

Tree number	Common name <i>Genus species</i>	Tree height (m)	Trunk diameter (cm)	Approximate branch spread (m)	Age	Physiological condition	Structural condition	Comments and recommendations
16	Corsican pine <i>Pinus nigra var maritima</i>	15-16	52 over ivy	5	EM	A	C#	Significant surface roots, particularly on church side, which have inevitably been damaged by mowing operations. Trunk clad in ivy extending to around 5m above ground level. At between 5m and 6.5m, the trunk divides into four leading stems with the uppermost examples having an acute union which, as best as could be viewed from ground level, likely has a degree of included bark. The lowest branch extending over the boundary has foliage within around 20cm of the apex of the roof of a neighbouring outbuilding. The upper crown of the tree is suppressing the adjacent deodar cedar. Given the proximity to the boundary and what is considered poor structural configuration, the tree is not considered suitable for retention into full maturity with what appears to be a weak fork significantly increasing the likelihood of stem breakage. It is recommended that the tree be proactively removed which will allow much improved room for development for the adjacent cedar.
