

1. The site of the proposed PV Solar panels installation is an existing Dry Lot, with no vegetation and an existing isolated gravel surface finish.
2. The short route to connect to the existing electrical cable is through the kennel grounds from the dry lot, and again this is a developed yard with no significant means of biodiversity support of protected species or vegetation.
3. The works will involve a trench to be dug in the kennels yard, which is currently an outdoor space with kennels and dog walking area.
4. The connection works would be executed within a week from starting and the trench area will be reinstated to its existing state within that time.
