

Biodiversity Net Gain Report

Paddock View, Twycross Road, Sheepy Magna, Atherstone, CV9 3RT

V 1.1

Matthew Kirby BSc
OAK ECOLOGY LTD

Executive Summary

- Oak Ecology were commissioned to conduct a Biodiversity Net Gain assessment of Paddock View, Twycross Road, Sheepy Magna, Atherstone, CV9 3RT.
- The application was for an extension to the north aspect of the building.
- Three distinct habitat were identified on-site, Cereal crop, Developed land, and Vegetated garden. The development would result in a small loss of cereal crop and creation of developed land, and vegetated garden.
- No protected species were identified on-site or noted to be utilising the site. There are no foreseen impacts to any protected species.
- The on-site habitat changes would result in a small deficit. Scheme alterations or off-site habitat creation would be required.
- Off-site habitat creation is possible within a small area of cropland north of the redline boundary. Planting two small native trees within the off-site area would generate enough units to elevate the deficit.

Title: Biodiversity Net Gain Report

Author: Matthew Kirby BSc, Oak Ecology Ltd

Client: Mr Pratt

Preparation of this document was produced using the information provided by the client.

Version	Author	Date issued	Summary of revision
Draft	Matthew Kirby	08/05/2026	Initial draft
V 1.0	Matthew Kirby	15/05/2026	Ready to issue
V1.1	Matthew Kirby	19/05/2026	Minor amendments

This report is valid for up to 12 months after the initial survey date. After this time, a new survey will be required.

The information within this report is based on the information gathered at the time of the survey, the possibility of other ecological issues arising in the cannot be eliminated.

This report remains the property of Oak Ecology Ltd until payment has been made in full.

1. Introduction

1.1. Commission brief

Oak Ecology were commissioned to undertake a Biodiversity Net Gain (BNG) assessment of Paddock View, Twycross Road, Sheepy Magna, Atherstone, CV9 3RT (hereafter referred to as the “site”).

1.2. Site location

The site (centred at SK 32875 01898) consisted of a residential dwelling with associated landscaping and a small arable plot. s. The surrounding landscape was primarily arable and rural, with small areas of sub-urban developments in Sheepy Magna.

Figure 1: Red Line Boundary.

Figure 2: 1Km Buffer zone around site.

1.3. Proposed development

It is understood that the site would be subject to a planning application for an extension to the north of the existing building and alterations to the front access.

1.4. Scope of the survey

BNG

The purpose of this survey was to:

- Identify and provide a description of the habitats present on the site.
- Identify potential ecological enhancements on the site.
- Evaluate the biodiversity units of the habitats on site.

1.5. Legislation and planning policy

UK and European policies and legislation deal with conservation of biodiversity. This section briefly outlines the legal and policy protection afforded to species and habitats scoped into this survey and described within the report.

1.5.1. Priority habitats and species

The NERC Act 2006 places a duty on public authorities to conserve biodiversity. It also states that a list of priority species and actions must be drawn up and contains species and habitats of principal importance for the purpose of conserving biodiversity. These lists of Priority Species and Priority Habitats, which encompass the previous UK Biodiversity Action Plan (BAP) habitats and species, are those identified as being the most threatened and requiring conservation action. Priority habitats and species were chosen based on international importance, rapid decline, and high risk. The list contains over 1000 habitats and species in total.

1.5.2. Biodiversity Net Gain (BNG)

Mandatory BNG is a part of the Environment Act 2021 requiring developments in England to have more or higher quality habitats than prior to the development. From 12th February 2024 all major developments were required to meet a minimum 10% increase in biodiversity units, calculated from the Statutory Biodiversity Metric. On 2nd April 2024, the mandatory 10% was extended to 'small sites'.

1.5.3. BNG rules

Rule 1 – The trading rules of this biodiversity metric must be followed.

Rule 2 – Biodiversity unit outputs, for each type of unit, must not be summed, traded, or converted between types. The requirement to deliver at least a 10% net gain applies to each type of unit.

Rule 3 – To accurately apply the biodiversity metric formula, you must use the statutory biodiversity metric calculation tool or small sites biodiversity metric tool (SSM) for small sites. The tools remove the need for a user to manually calculate the change in biodiversity value. The tool will summarise the results of the calculation and inform a user whether the biodiversity net gain objective has been met.

Rule 4 – In exceptional ecological circumstances, deviation from this biodiversity metric methodology may be permitted by the relevant planning authority.

1.5.4. Trading rules

The trading rules only apply to no net loss.

Table 1: Trading rules summary.

Distinctiveness	Area	Linear	Watercourse
Very High	Priority should be given to replacing losses with units of the same habitat type.	Losses must be replaced with units of the same habitat type	Priority should be given to replacing losses with units of the same habitat type.
High	Losses must be replaced with units of the same habitat type	Losses must be replaced with units of the same habitat or of a higher band.	Losses must be replaced with units of the same habitat type
Medium	Losses must be replaced by units of either medium band habitats within the same broad habitat type or, any habitat from a higher band from any broad habitat type	Losses must be replaced with units of the same or of a higher band	Losses must be replaced with units of the same habitat type
Low	Losses must be replaced with units of the same or higher band	Losses must be replaced with units of the same or of a higher band	Losses must be replaced with units of a higher band
Very Low	N/A	Losses must be replaced with units of the same or of a higher band.	N/A

1.5.5. BNG Principles

Principle 1 – The metric assessment should be completed by a competent person.

Principle 2 – The use of this biodiversity metric does not override existing biodiversity protections, statutory obligations, policy requirements, ecological mitigation hierarchy, or any other requirements. This includes consenting or licensing processes, for example woodlands.

Principle 3 – This biodiversity metric should be used in accordance with established good practice guidance and professional codes.

Principle 4 – This biodiversity metric is not a complex or comprehensive ecological model and is not a substitute for expert ecological advice.

Principle 5 – Biodiversity units are a proxy for biodiversity and should be treated as relative values.

Principle 6 – This biodiversity metric is designed to inform decisions in conjunction with locally relevant evidence, expert input, or guidance.

Principle 7 – Habitat interventions need to be realistic and deliverable within a relevant project timeframe.

Principle 8 – Created and enhanced habitats should be, where practical and reasonable, local to any impact and deliver strategically important outcomes for nature conservation.

Principle 9 – This biodiversity metric does not enforce a minimum habitat size ratio for compensation of losses. Proposals should aim to:

- maintain habitat extent - supporting more, bigger, better, and more joined up ecological networks
- ensure that proposed or retained habitat parcels are of sufficient size for ecological function

1.5.6. Exemptions

The Biodiversity Gain Requirements (Exemptions) Regulations 2024 lists several exemptions for BNG that may be applicable.

Temporary exemption for small developments —

The application for planning permission for small development was made before 2nd April 2024; or planning permission is granted for small development which has effect before 2nd April 2024.

De minimis exemption

The biodiversity gain planning condition does not apply in relation to planning permission for development which meets the following conditions:

the development does not impact an onsite priority habitat and,

The development impacts— (a) less than 25 square metres of onsite habitat that has biodiversity value(b) greater than zero; and (b) less than 5 metres in length of onsite linear habitat.

Householder applications

The biodiversity gain planning condition does not apply in relation to planning permission for development which is the subject of a householder application within the meaning of article 2(1) of the Town and Country Planning (Development Management Procedure) (England) Order 2015.

Self-build and custom build applications

The biodiversity gain planning condition does not apply in relation to planning permission for development which— (a) consists of no more than 9 dwellings; (b) is carried out on a site which has an area no larger than 0.5 hectares; and (c) consists exclusively of dwellings which are self-build or custom housebuilding. (2) In this regulation “self-build or custom housebuilding” has the same meaning as in section 1(A1) of the Self-build and Custom Housebuilding Act 2015(a)

2. Methodology

2.1. Surveyors and equipment

The site was attended by Matthew Kirby, an ecologist with over 10 years' experience, on 1st May 2026.

2.2. Survey

The survey consisted of a site walkover to identify the key habitats within the Site. The UK Habitat Classification v2.0 was used to categorize the habitats (UKHAB Ltd, 2023). A minimum mapping units of 5m for linear habitats and 25m² for area habitats was used when creating the maps.

Notes and photos were taken throughout the site to document the habitats present. Any habitats or features that would be suitable for protected species were identified and marked with a target note on the maps.

The baseline and proposed habitats were digitally mapped in QGIS software. Details from the site walkover were then inputted into the Small Site Metric BNG Calculation Tool to calculate the feasibility of a 10% BNG.

2.3. Limitations

No limitations.

3. Results

3.1. Weather Conditions

Table 2: Weather conditions at the site on 01/05/2026.

Parameter	
Temperature	16 °C
Precipitation	0 – Dry
Wind speed	1 B – Light air
Cloud cover	0%

3.2. Desk Study

3.2.1. Protected species

A 1km search radius was conducted using Magic (2026), to identify any previous confirmed records of protected or notable species in the area. The search returned zero records of European Protected Species Mitigation licences (EPSM). There were records of invertebrates, birds, and mammals including otter all within a 1 km radius. However, no protected species were identified within the site boundary or the immediate vicinity. No impacts are envisioned in regard to these species.

3.2.2. Designated sites and priority habitats

One designated site within the 1km search radius of the site was identified.

Sheepy Fields Site of Special Scientific Interest (SSSI) – A 5.3 Ha area of good quality neutral grassland. Abundant sweet vernal grass, crested dog's tail, Yorkshire fog, and yellow oat-grass. Sheepy Fields SSSI was approximately 650m northeast of the site.

Three Priority Habitats Inventory (PHI) areas, and four areas in the National Forestry Index (NFI) were identified within a 1km search radius. The search identified deciduous woodland, lowland meadows, and traditional orchard. The NFI identified four woodland habitats: assumed woodland, broadleaved, mixed mainly broadleaved, and young trees.

An area of young trees was immediately adjacent of the west of the site. All other priority habitats were 250m or further from the site.

Figure 3: Wider landscape map.

3.3. Baseline habitats on-site

3.3.1. Area habitats baseline

A-1.1 Cereal crops (c1c)

A parcel of land north of the residential dwelling. At the time of the survey the area was more consistent with a vegetated garden. The BNG calculations were made using the habitat type before the change to vegetated garden. A condition assessment was not required for this habitat type

Size: 0.0123 Ha, Distinctiveness: Low, Condition: N/A, BNG Units: 0.02

A-1.2 Developed land; sealed surfaces (u1b)

Areas that included the residential dwelling and associated parking at the front of the property. The building was of relatively new construction with no damages or crevices that could be utilised by bats or birds. These habitat types did not have ecological value. A condition assessment was not required for this habitat type,

Size: 0.0438 Ha, Distinctiveness: Very Low, Condition: N/A, BNG Units: 0.00

A-1.3 Vegetated garden (u1b 107, 516, 828)

A private garden at the rear of the residential dwelling that was regularly maintained. There was no evidence to suggest this habitat was frequently used by any potential protected species. A condition assessment was not required for this habitat type.

Size: 0.0145 Ha, Distinctiveness: Low, Condition: N/A, BNG Units: 0.03

3.3.2. Linear habitats baseline

B-1.1 Native hedgerow

Small section of hedgerow running across the southeast perimeter of the cereal crop. The hedgerow was comprised of Hawthorn (*Crataegus monogyna*), Elder (*Sambucus nigra*), and Ivy (*Hedera helix*) in good condition with minor gaps.

Length: 0.015 Km, Distinctiveness: Low, Condition: Good, BNG Units: 0.09

3.4. Baseline habitats off-site

3.4.1. Area habitats baseline

D-1.1 Cereal crops (c1c)

Same habitat type and condition as A-1.1.

Size: 0.0339 Ha, Distinctiveness: Low, Condition: N/A, BNG Units

Figure 4: Baseline habitat map.
Biodiversity Net Gain Report

Figure 5: Off-site Baseline habitat map.
Biodiversity Net Gain Report

3.5. Created habitats on-site

3.5.1. Area habitats proposed

A-2.1 Developed land; sealed surfaces (u1b)

Small extension to the north aspect of the existing building. This would result in the loss of 50 m² of cereal crop.

Size: 0.005 Ha, Distinctiveness: Very Low, Condition: N/A, BNG Units: 0.00

A-2.2 Vegetated garden (u1b)

Change of use of a small section of cereal crop to vegetated garden.

Size: 0.007 Ha, Distinctiveness: Low, Condition: N/A, BNG Units: 0.01

3.5.2. Linear habitats proposed

B-2.1 Native Hedgerow

Planting of native hedgerow to around the perimeter of the new extension. A realistic condition of the proposed hedgerow would be poor/moderate.

Size: 0.022 Km, Distinctiveness: Low, Condition: Poor, BNG Units: 0.04

3.6. Created habitats off-site

3.6.1. Area habitats proposed

D-2.1 Urban trees

Proposed planting of two small (diameter >30cm) native trees within the off-site area. The trees would be recommended to achieve a moderate condition. The target size and condition of the proposed trees was deemed the most appropriate for this setting. The area of trees is not included in the overall site area.

Size: 0.0082 Ha, Distinctiveness: Medium, Condition: Moderate, BNG Units: 0.03

Figure 6: Proposed habitat map.
Biodiversity Net Gain Report

Figure 7: Off-site proposed habitat map.
Biodiversity Net Gain Report

3.7. Baseline units

3.7.1. Area habitats

Any discrepancies between the values shown below and the calculations in the metric are due to rounding. The unit calculations in the metric were completed with unmodified values but rounded to 2 decimal places for clarity.

Table 3: On-site Area habitat summary.

Ref	Habitat	Area (Ha)	BNG units
A-1.1	Cropland – Cereal crop	0.01	0.02

Biodiversity Net Gain Report

4. Feasibility of Biodiversity Net Gain

4.1. Area habitats

The site had a baseline unit value of 0.05. To achieve a 10% net gain the proposed development would need at least 0.06 units.

Based on the site plans provided, the proposed development would result in the loss of a small section of cereal crop which would be replaced by developed land; sealed surfaces, and vegetated garden. The change in habitat would result in a loss of 0.02 units.

The deficit can be compensated through off-site habitat creation. Planting two small native trees on the off-site area immediately north of the site would generate 0.03 units, and a 26.08% net increase. The size of the trees would be deemed appropriate for the setting, anything larger than small trees would be more difficult and less feasible.

4.2. Linear habitats

The site had a baseline unit value of 0.09. To achieve a 10% net gain the proposed development would need at least 0.10 units.

22m of native hedgerow is proposed to be planted around the perimeter of the extension. Poor condition was deemed the more realistic condition of the hedgerow. This would generate 0.04 units and a 47.18% net increase.

4.3. Conclusion

Through off-site habitat creation the proposed development can meet the BNG requirements.

Should the client or local planning authority deem the on-site habitat enhancement unfeasible then scheme alterations or off-site credits would be needed to be purchased.

The impacts from the proposed development would be minor and localised to the site only. Best practice construction guidelines should always be followed to reduce the risk to the surrounding habitats.

5. Conclusion and Recommendations

5.1. Conclusion

No protected species or habitats were identified on-site. The site had an overall very low ecological value and any adverse impacts to wildlife would be considered negligible. The site was in close proximity to a young woodland which had more favourable habitats. The proposed development would only have effects at the site level and not impact on any of the neighbouring habitats.

5.2. Further Surveys

No further surveys are required.

5.3. Mitigation hierarchy

The mitigation hierarchy should be used to limit the negative impacts to biodiversity. The steps below are recommendations of the best practice guidelines. They are optional, unless stated as a condition from the Local Planning Authority or as a requirement of any licences. The Local Planning Authority may also request additional reports such as Precautionary Working Method Statements (PWMS), lighting plans, or monitoring plans.

5.3.1. Mitigation (minimise)

The development has proposed the smallest red line boundary possible to still achieve the desired development. Steps should be taken to not adversely affect areas outside the redline boundary during the construction. Best practice construction guidelines should be followed to prevent harmful spillages into the nearby River Cole.

5.3.2. Compensation

The proposed development would seek improve the biodiversity of the remaining site as compensation for the lost habitat.

5.3.3. Enhancements

Measures can be undertaken as a way to further enhance the overall biodiversity and fauna populations of the habitats surrounding the site. The abundance of invertebrates can be increased through good landscaping practices, such as allowing some grassy areas to grow taller, installing a water feature, and native planting schemes. This will provide better foraging opportunities for wildlife. Refuges and boxes could be installed to provide wildlife places to shelter.
