Scott,

Further to our recent conversation please find additional information below.

The building will be used to feed and sawdust as previously described in the supporting documentation. The sawdust is currently stored outside and used at regular intervals during the farm cycle. Currently all of the sawdust is used during each cycle and replenished ready for the next. The building is required to minimise wastage of the sawdust due to damaged packing and inclement weather. In addition the applicant wishes to use the additional space created by the building to enable him to purchase larger quantities when the price is low to enhance the financial liability of the unit.

The second part of the building will be used to secure farm machinery and equipment. The building will store a number of items including the following:
Telehandler (Forklift)
Tractor & Mower
Washing and cleaning equipment including a bobcat front loader.
Bedding Spreader
Feed Applicators
Various spare components including fans, feeders, & heaters.

Although not all of the above items are on site at all times, they are all present during the normal farm cycle and require secure storage during those periods.

Regards

Lee Morphy
